## Results:

In the 2006-2007 school year, the California Physical Fitness Test (PFT) was administered to a total of 23,412 Stanislaus students, representing $94 \%$ of students enrolled in Stanislaus public schools for grades five, seven and nine. During this time, 7971 Grade 5 students, 7769 Grade 7 students and 7672 Grade 9 students were tested. Three components of health related physical fitness were measured: aerobic capacity; body composition; muscular strength, endurance and flexibility. All students should strive to achieve a score within the health fitness zone.

The Health Fitness Zone (HFZ) is the desired performance goal for each of the fitness area.
The most important indicator of physical fitness is Aerobic Capacity. It assesses the capacity of the cardiorespiratory system and is measured by endurance. 50- to 67 percent of students were in the HFZ across all grades

Body composition results provide an estimate of the percent of a student's weight that is fat in contrast to the "fat-free" body mass. 64 - to 66- percent of students were in the HFZ across all grades

Stanislaus students are at a reasonable level of physical fitness as more than half ( $>50 \%$ ) of the students in each grade were in the health fitness zone for all the physical fitness areas. More than half ( $>50 \%$ ) of the students in each grade also met three or more of the six fitness criteria.

## Importance of Physical Fitness:

Lack of physical activity is a risk factor to many chronic conditions such as obesity, coronary heart disease, stroke, high blood pressure and high cholesterol. Regular physical activity combined with a healthy diet will help improve your overall health and reduce your risk of premature death.
